Experiment-15

Career Pathways And The Future Of Low Code Development

Aim:

To develop a Library Book Issue Management System using Zoho Creator to store student details, maintain book issue records, track issue dates and due dates, monitor book issue status, and display the submitted records through reports and a dashboard.

Theory:

Zoho Creator is a low-code application development platform that allows users to create applications using forms, reports, dashboards, and workflows with minimal programming.

The Library Book Issue Management System is designed to manage library book issue records efficiently. It stores information such as Student ID,

Student Name, Department, Book ID, Book Title, Book Category, Issue Date, Due Date, and Issue Status.

The application consists of the following components:

- **Form:** Used to enter and submit student and book issue details.
- **Report:** Displays the submitted records in a tabular format for easy viewing and management.
- **Dashboard:** Presents library information using charts, panels, and other visual components.
- **Workflow:** Used to automate actions based on specified events or conditions, such as updating a book's issue status.

This application helps reduce manual record-keeping, improves data organization, and makes library book issue information easier to access.

Procedure:

1. Open Zoho Creator and create a new application named *Library Book Issue*.
2. Create a form named *Library Book Issue Form*.
3. Add the following fields to the form:

    a. Student ID
    b. Student Name
    c. Department
    d. Book ID
    e. Book Title
    f. Book Category
    g. Issue Date
    h. Due Date
    i. Issue Status
4. Configure the dropdown fields with suitable options for Department, Book Category, and Issue Status.
5. Save the form and submit sample records containing student and book details.
6. Create or open the associated report named *All Library Book Issues* to view the submitted records in a table.
7. Create a page named *Library Dashboard*.
8. Add suitable dashboard components, such as a Panel, Chart, Gauge, and Report, according to the required design.

9. Configure the chart to display the number of book issue records by category.
10. Open the Workflows section and configure suitable workflow rules to automate library record management.
11. Test the application by submitting sample records and verifying that they appear in the report and dashboard.

Result:

Thus, the Library Book Issue Management System was developed using Zoho Creator. The application enables users to enter student and book issue details, view submitted records through reports, and organize library information using a dashboard. Workflow automation can further improve the efficiency of book issue status management and reduce manual effort.
